

MACHINE LEARNING OPERATIONS MATURITY MODEL

5 Stages Architecture View

Level 0 – No MLOps

- Find best model interactively and exploratory.
- Create environment, gather and preprocess data, model training, deploy and test manually.

ML Platform created manually

People

- Data scientists: siloed, not in regular communications with the larger team
- Data engineers (if exists:(siloed, not in regular communications with the larger team
- Software engineers: siloed, receive model remotely from the other team members

Model Creation

- Data gathered manually
- · Compute is likely not managed
- · Experiments aren't predictably tracked
- End result may be a single model file manually handed off with inputs/outputs

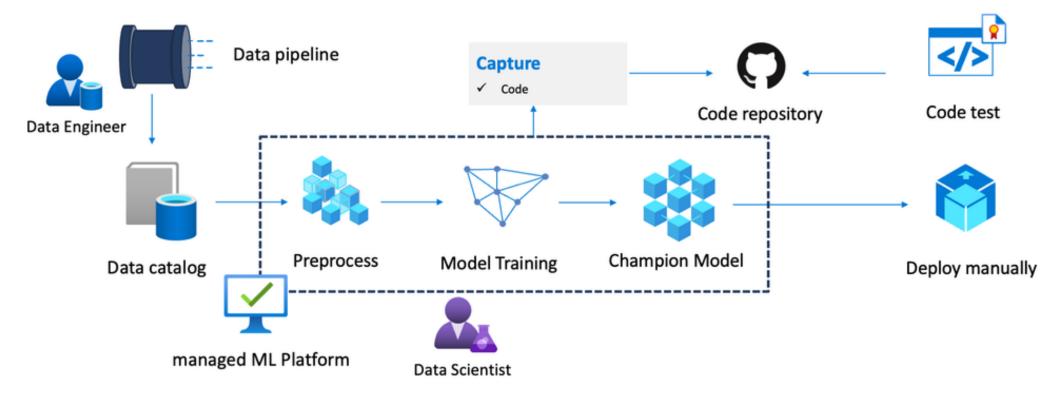

Model Release

- Manual process
- Scoring script may be manually created well after experiments, not version controlled
- Release handled by data scientist or data engineer alone

- Heavily reliant on data scientist expertise to implement
- Manual releases each time

Level 1 – DevOps no MLOps

- · Create managed ML platform.
- Maintain code test against application and training/inference scripts.

People

- Data scientists: siloed, not in regular communications with the larger team
- Data engineers (if exists): siloed, not in regular communication with the larger team
- Software engineers: siloed, receive model remotely from the other team members

Model Creation

- Data pipeline gathers data automatically
- · Compute is or isn't managed
- Experiments aren't predictably tracked
- End result may be a single model file manually handed off with inputs/outputs

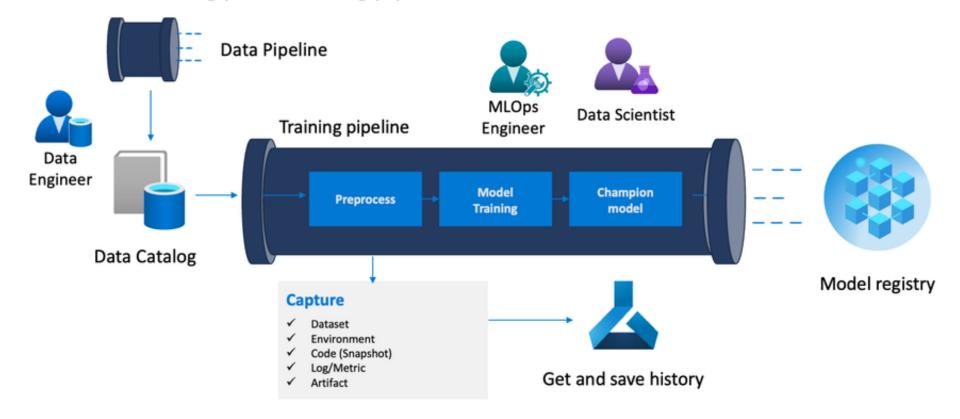

Model Release

- Manual process
- Scoring script may be manually created well after experiments, likely version controlled
- Is handed off to software engineers

- Basic integration tests exist for the model
- Heavily reliant on data scientist expertise to implement model
- · Releases automated
- Application code has unit tests

Level 2 – Automated Training

- · Make Code, Data, Model tracked, saved and version controlled.
- · Automate training process using pipeline.

People

- Data scientists: Working directly with data engineers to convert experimentation code into repeatable scripts/jobs
- · Data engineers: Working with data scientists
- Software engineers: siloed, receive model remotely from the other team members

Model Creation

- Data pipeline gathers data automatically
- Compute managed
- Experiment results tracked
- Both training code and resulting models are version controlled

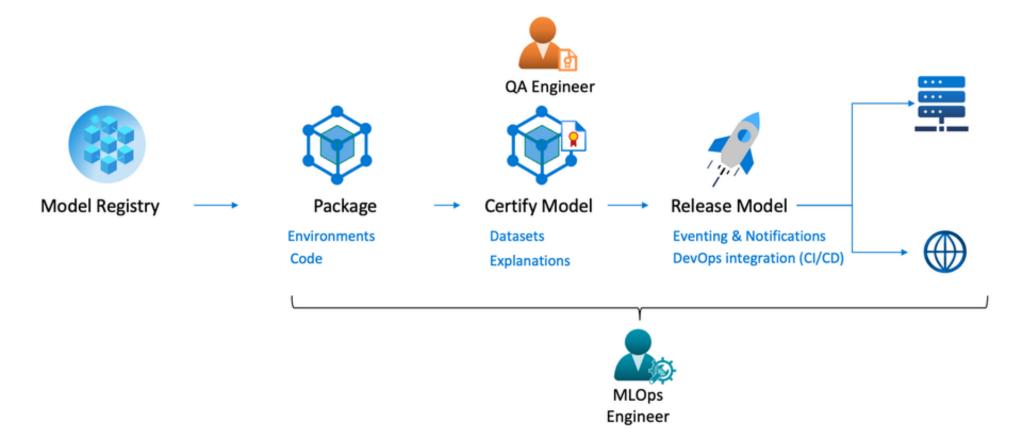

Model Release

- Manual release
- Scoring script is version controlled with tests
- Release managed by Software engineering team

- Basic integration tests exist for the model
- Heavily reliant on data scientist expertise to implement model
- Application code has unit tests

Level 3 – Automated Model Deployment

· Package model, Certify Model and release model are semi-automated.

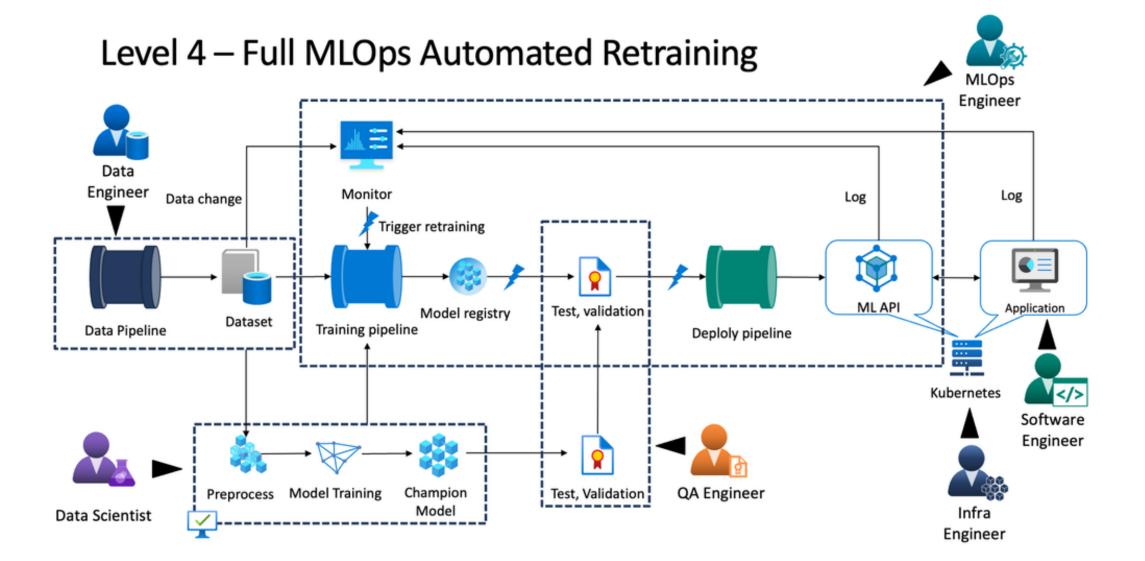

People Data scientists: Working directly with data engineers to convert experimentation code into repeatable scripts/jobs Data engineers: Working with data scientists and software engineers to manage inputs/outputs Software engineers: Working with data engineers to automate model integration into application code Model Creation Data pipeline gathers data automatically Compute managed Experiment results tracked Both training code and resulting models are version controlled

Model Release

- Automatic release
- Scoring script is version controlled with tests
- Release managed by continuous delivery (CI/CD) pipeline

- Unit and integration tests for each model release
- Less reliant on data scientist expertise to implement model
- Application code has unit/integration tests

Model Creation People Data pipeline gathers data Data scientists: Working directly with data engineers to convert autom atically experimentation code into repeatable scripts/jobs. Working with Retraining triggered software engineers to identify markers for data engineers automatically based on · Data engineers: Working with data scientists and software engineers to production metrics manage inputs/outputs Compute managed Software engineers: Working with data engineers to automate model Experiment results tracked integration into application code. Implementing post-deployment Both training code and metrics gathering resulting models are version controlled

Automatic Release Scoring Script is version controlled with tests Release managed by continuous integration and CI/CD pipeline Unit and Integration tests for each model release Less reliant on data scientist expertise to implement model Application code has unit/integration tests
